

STOP IRREVERSIBLE AND OFF-LABEL “TREATMENTS” ON AMERICA’S CHILDREN

February 22, 2023

The U.S. has some of the most permissive laws regarding transgender treatments for children. Doctors often prescribe **irreversible and off-label** treatments for transgender children.

TRANSGENDERISM IN CHILDREN IS A GROWING TREND IN THE U.S.

Transgenderism in children is a growing trend in the U.S.:

300,000+

CHILDREN AGES 13-17
ARE TRANSGENDER

The number of children known to be on puberty blockers or cross-sex hormones in the U.S. **more than doubled** between 2017 and 2021.

Puberty Blockers and Cross-Sex Hormones given to children are often prescribed for off-label (**unapproved by the Food and Drug Administration**) use. Some of the known dangerous side effects of these drugs include:

LOWERED
BONE DENSITY

STUNTED
GROWTH

PERMANENT
INFERTILITY

Little evidence of mental health benefits of these “treatments” for children **has been found**. A large cohort study found **NO advantage of surgery on mental health outcomes** for those who received surgical interventions compared to those who did not.

Radical groups and some medical professionals are pushing **irreversible genital mutilation and surgeries** as a preferred “treatment” path for America’s children, such as:

- X** Mastectomy
- X** Ovariectomy
- X** Uterine extirpation
- X** Penile Disablement
- X** Tracheal Shave

ONLY
12-27%

of children with gender dysphoria (the medical term for psychological distress associated with transgenderism) carry this condition into adulthood.

Still, many children in the U.S. are receiving irreversible therapies & surgeries.

59% of registered voters

believe it should be against the law to provide “**gender-affirming care**” to children, which involves puberty blockers or surgery to help transition a boy to a girl or a girl to a boy.

States should adopt policies to protect children from potentially harmful, irreversible, and unapproved sex reassignment surgeries and medications.
